Problem 1

Answer to the problem goes here.

- 1. Problem 1 part 1 answer here.
- 2. Problem 1 part 2 answer here.

Here is an example typesetting mathematics in LATEX

$$X(m,n) = \left\{ \begin{array}{ll} x(n), & \text{for } 0 \le n \le 1 \\ \frac{x(n-1)}{2}, & \text{for } 0 \le n \le 1 \\ \log_2 \lceil n \rceil & \text{for } 0 \le n \le 1 \end{array} \right\} = xy$$

3. Problem 1 part 3 answer here.

Here is an example of how you can insert a figure.

Figure 1: This is a figure.

Problem 2

A Code

Here is an example of how you can type set algorithms. There are many packages to do this in \LaTeX

Algorithm 1: Caption for code

```
model
{
    for(i in 1:nSUB)
    {
        s[i] ~ dnorm(0, tau. precision);
    }
}
```
